

# Running App process (ADB & AVD)

--> AVD (Android Virtual Device): ADB is a command-line tool that allows communication between a development machine and an Android device or emulator. It's a versatile tool for various tasks, including installing and debugging applications.

--> ADB (Android Debug Bridge): ADB is a command-line tool that allows communication between a development machine and an Android device or emulator. It's a versatile tool for various tasks, including installing and debugging applications.

⌘ In summary, ADB is a versatile tool for managing both physical devices and emulators, while AVD specifically focuses on emulating Android devices on your development machine. They work together to facilitate the development and debugging process for Android applications.
